

Australian RC412

RAM uses Virgin Australian RC412 Carbon which is widely considered to be the superior carbon for air filtration.

It is 65% CTC carbon which means that the specification of RC412 carbon used takes on board 65% of its own density in volatile airborne molecules (smell). It has a very low ash content of less than 13% and is a virgin granulated product. In this form, the carbon can be compacted very tightly leaving no air spaces where organic compounds (odours) can escape.
